

ON-SHORE WIND FARM SITE SELECTION IN VIRGINIA

Nimish Sheth

Energy Future

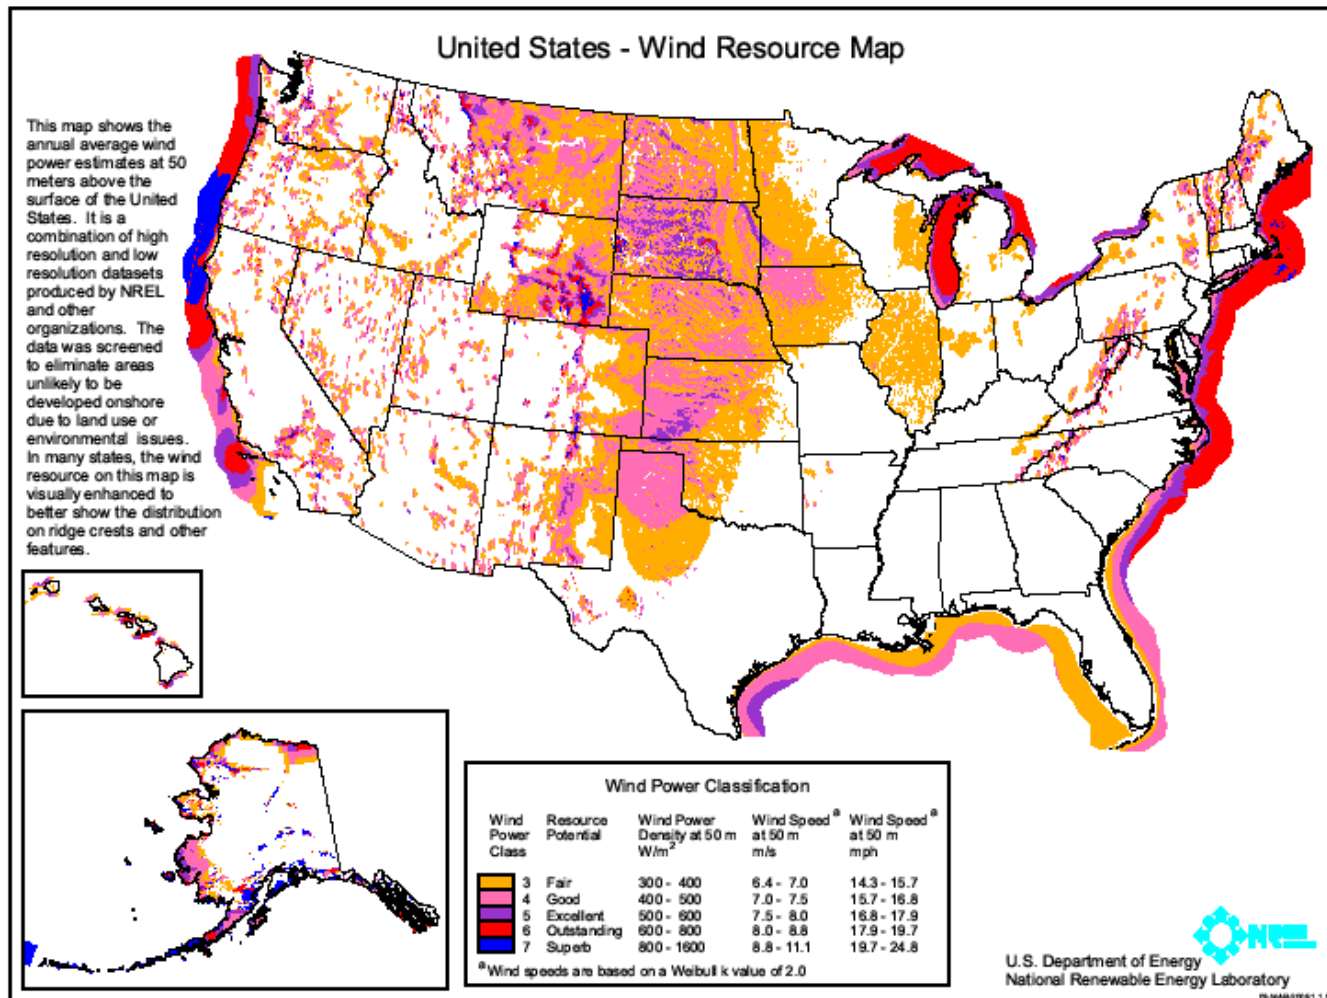

- Increasing energy demand and supply dependencies
 - Critical environmental concerns due to unsustainable use of fossil fuels
 - Imperative to adopt clean and renewable energy
 - U.S. Dept. of Energy : 20% Wind Energy by 2030 scenario
- 

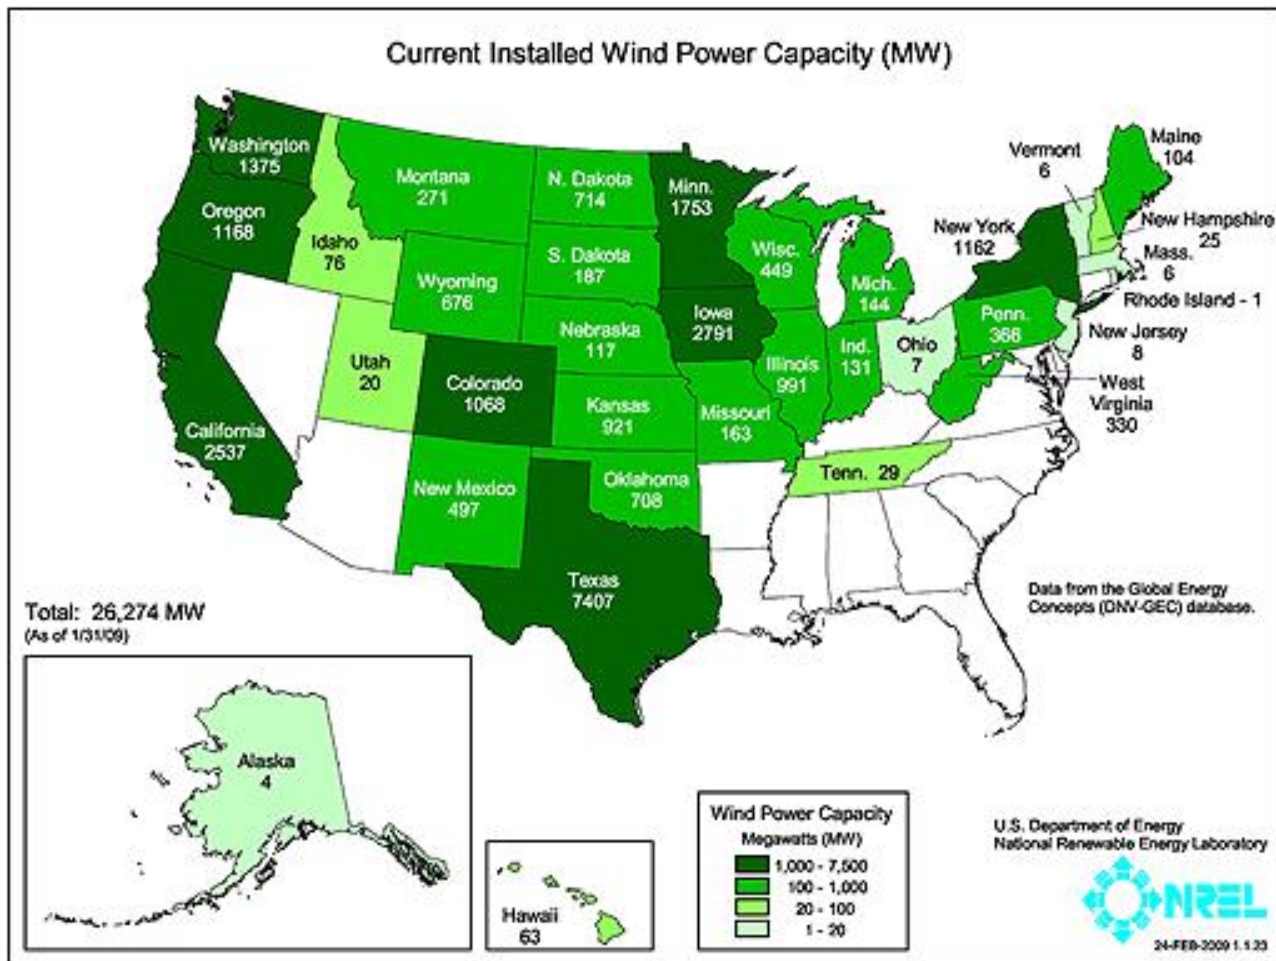

Goals

- Identify potential on-shore locations for wind farm sites in Virginia
 - Use GIS for the site selection process
 - Create a series of maps to visualize the analysis outcome and recommend sites (if any) meeting selection criteria
- 

United States - Wind Resource

Current Installed Capacity

Methodology

- **Wind resource potential at 50 meters**
 - Wind power class: 1 (poor) – 7 (superb)
 - **Constraints – land use, population centers**
 - All land with wind energy resource may not be suitable for wind farm development
 - Issues in populated areas - safety, public opposition, insufficient land
 - **Factors – transportation access, transmission lines**
 - Roads for construction, operations, and maintenance
 - Leverage existing energy infrastructure
- 

Data Layers

Data	Source
Wind Resource Potential	National Renewable Energy Laboratory & TrueWind (shapefile generated from original raster data with 200m resolution; 2003)
Conservation Lands (NPS, AT, USFS, USFWS, VA-DCR, VA-DOF, VA-DGIF, Local, Private, The Nature Conservancy) Military Lands (Dept. of Defense)	Virginia Department of Conservation and Recreation (2008) Appalachian Trail Conservancy (2002)
Population	ESRI, Census Bureau (multiple sources; 2004), Appalachian Trail (2002-03)
Roads	Bureau of Transportation Statistics (2008)
Transmission Lines	gecomm.com, Virginia Tech Dept. of Mines, Minerals, and Energy

All data used in the project is publicly available and free.

Data Preparation

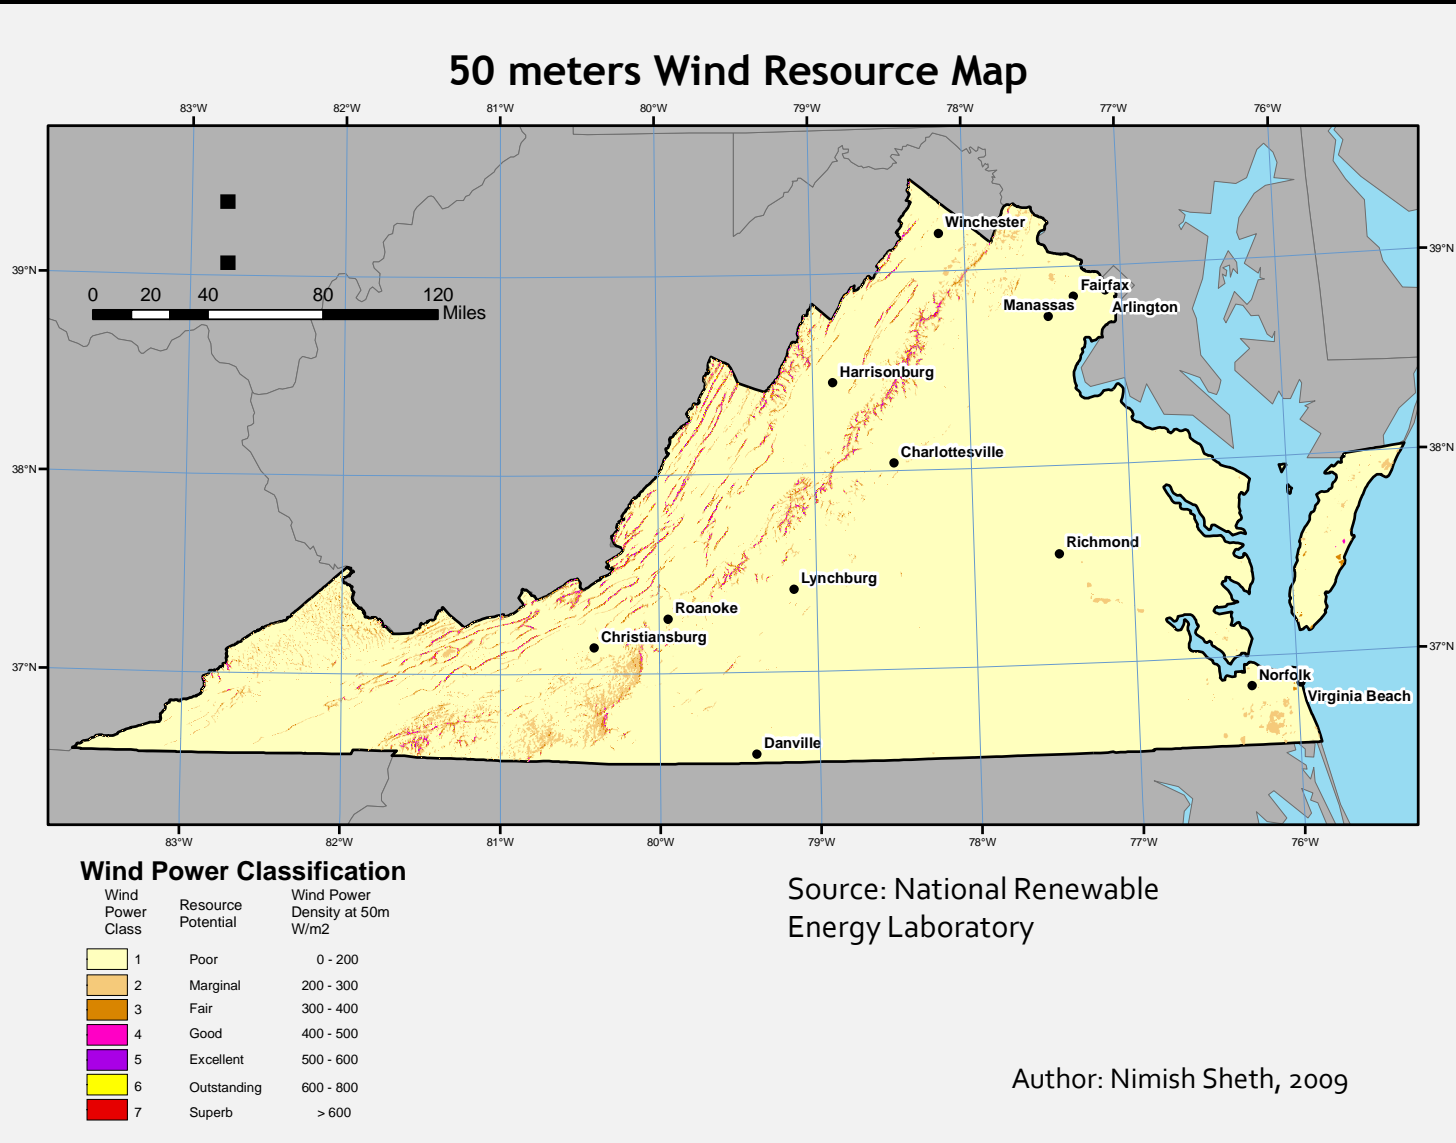

- Convert layers to GCS - North American Datum 1983; PCS - UTM Zone 17N
 - Clip wind resource layer to Virginia
 - Set up conservation lands, 10-mile AT buffer, and military areas
 - Calculate 2003 population density (per sq. mile)
 - Set up major roads – interstates, major roads, and other important arteries
 - Transmission lines – digitize high capacity transmission lines from Geocomm.com shapefile and schematic from Virginia Energy Patterns and Trends
 - Import, manage, and analyze data in a personal geo-database, after preliminary processing of shapefiles
 - Create metadata for new or modified layers (e.g., transmission lines) (overall, good metadata available with all other layers)
- 

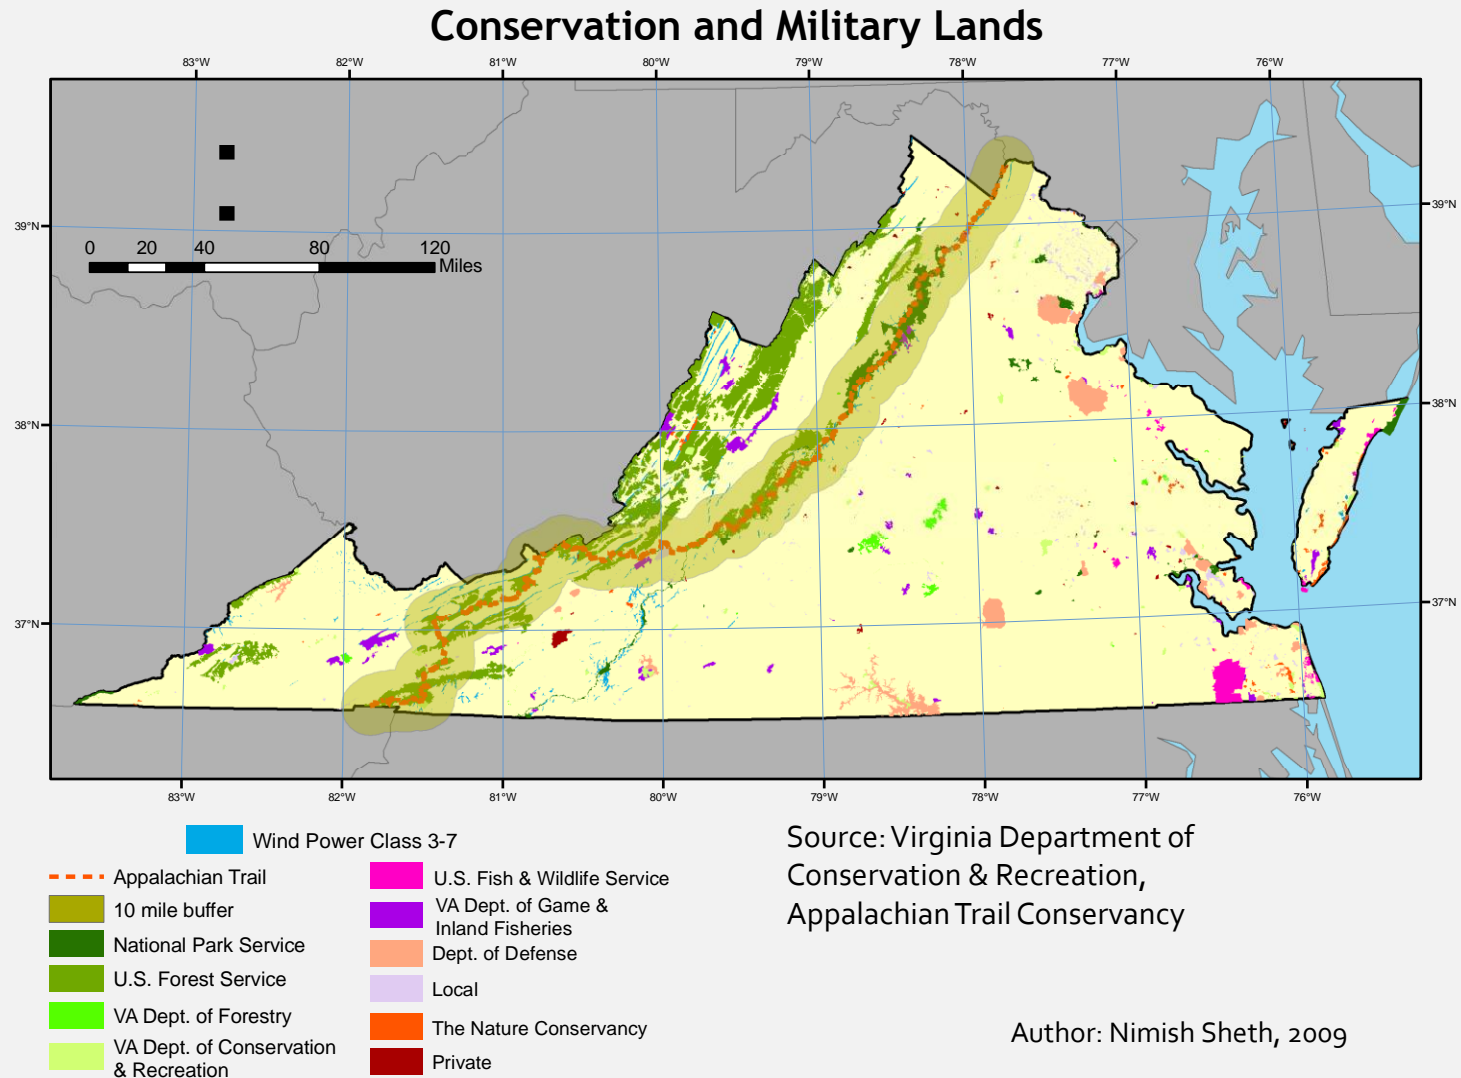

Site Selection Process

- Wind power classes 3-7 suitable for utility wind (exclude areas with wind class 1-2)
 - Exclude conservation lands
 - Exclude counties with population density > 500
 - Select areas within 5 miles of roads
 - Select areas within 10 miles of transmission lines.

Proposed Sites

Final Sites Satisfying Selection Criteria for Wind Farms

Author: Nimish Sheth, 2009

Proposed Sites (cont.)

Wind Power Classification

Wind Power Class	Resource Potential	Wind Power Density at 50m W/m ²
3	Fair	300 - 400
4	Good	400 - 500
5	Excellent	500 - 600
6	Outstanding	600 - 800
7	Superb	> 600

Wind Power Classification

Wind Power Class	Resource Potential	Wind Power Density at 50m W/m ²
3	Fair	300 - 400
4	Good	400 - 500
5	Excellent	500 - 600
6	Outstanding	600 - 800
7	Superb	> 600

Wind Power Classification

Wind Power Class	Resource Potential	Wind Power Density at 50m W/m ²
3	Fair	300 - 400
4	Good	400 - 500
5	Excellent	500 - 600
6	Outstanding	600 - 800
7	Superb	> 600

Wind Power Classification

Wind Power Class	Resource Potential	Wind Power Density at 50m W/m ²
3	Fair	300 - 400
4	Good	400 - 500
5	Excellent	500 - 600
6	Outstanding	600 - 800
7	Superb	> 600

Limitations

- Site capacity
 - Slope
 - Vegetation and Soil
 - Terrain orientation to prevailing wind (parallel v. perpendicular)
 - Airports
 - Water bodies
 - Cost-benefit analysis
 - Avian and wildlife Impact – population, migration routes
 - Landowner concerns
 - Visual impacts
- 

Future Analysis

- Offshore Wind
 - 70m – 100m wind potential for new technology turbines
-
